

**SOLUTIONS³**

Cyberside Chats: Summer Edition

Weekly Recap

Special points of interest:

- Solutions³ Intern Field Trip
- Quantum Leap or Cyber Risk?
- Clorox Sues IT Firm Over Breach
- Helper or Hinder? How AI Enhances Accessibility

This week marked week 9 of the Solutions3 LLC internship and the beginning of week 2 in our Risk Management Framework pathway. Interns built on last week's foundation by diving into identifying key ideas in Risk Management, where interns took part in advancing their knowledge in Hack the Box training, focusing on OSINT Corporate Reconnaissance and network traffic analysis. These exercises sharpened interns' practical skills in identifying external threats and understanding data flow across networks.

Tuesday brought interns an insightful professional development session centered on resilience, exploring strategies to maintain focus, adapt under pressure, and bounce back from setbacks in high-pressure environments.

This week's vendor of the week had a special guest, Ariel Evans, founder of RiskQ, who shared valuable industry insights on risk qualification and managing cybersecurity from a business-centric perspective.

Interns were also assigned a set of deliverables where they completed a Network Traffic Analysis report that detailed suspicious patterns, as well as an OSINT Risk Exposure Summary highlighting publicly available data that could pose risks to their mock company Falconi.

Overall, this week was full and productive, challenging interns to grow both technically and professionally as they continue progressing through the Solutions3 internship experience.

Vendor of the Week: RiskQ

This week, the interns met with Ariel Evans, President of RiskQ, to explore the RiskQ platform for cybersecurity risk quantification.

She explained how the risk engine models estimate potential financial losses from data breaches, business interruptions, and regulatory pen-

alties. These insights help CISOs and compliance officers prioritize remediation based on financial impact.

Evans also covered third-party risk management, AI governance challenges, and the benefits of unified compliance frameworks. I find it

interesting because it transforms cyber risks into solid financial scenarios and simplifies decision-making. It also helps bridge the gap between cybersecurity and business strategy, making it easier to communicate risk and secure the resources needed for protection.

Collaboration doesn't stop at the office.

Solutions³ Intern Field Trip

This past Sunday, interns from Solutions³ met for the very first time in person! Proposed by the interns themselves, they wanted the opportunity to meet one another and strengthen the overall team bond. So all interns met up at Round 1 Bowling & Arcade in Jersey Gardens.

After introductions were made, interns participated in a friendly bowling competition; the highest individual and team scores would be the winners for the night.

The competition was fierce, with many interns showcasing their bowling skills; nevertheless, it was a night of fun, friendly competition.

Once the bowling competition was settled, interns went on to explore the arcade and participate in various arcade games. From air hockey to a couple of interns winning prizes from claw machines, interns hopped from one game to the next as they got to know one another.

As the night came to an end, and after a fierce debate between Fantastic Four vs Superman, the field trip concluded.

Group and team photos were taken to remember the occasion, and goodbyes were exchanged thereafter. If one thing is for certain, this field trip was great for team bonding, helping bring our group closer together.

“What we believe is secure today might not be tomorrow”

Quantum Leap or Cyber Risk?

Quantum computing is one of the next big technological advancements; however, it also brings along some serious cybersecurity concerns. Unlike regular computers, quantum computers can process massive amounts of data all at once.

This means they would be able to break widely used encryption schemes such as RSA and ECC encryption, thought to be computationally secure, which are commonly used to protect our

data all over the internet. This means what we believe is secure today might not be tomorrow.

But it's not all bad news. Quantum tech also offers new ways to secure information, like quantum key distribution, which uses the laws of physics to create nearly unbreakable keys.

Cybersecurity experts and companies are also already working on “post-quantum” encryption methods built to withstand quantum

attacks.

While quantum computers are still years away, it's important that the cybersecurity world is already preparing for a quantum-powered future.

Clorox: IT Vendor Gave Hackers Access

Clorox has filed a lawsuit against its former IT support provider Cognizant following a 2023 cyberattack that caused \$380 million in damages.

The lawsuit claims hackers from the group Scattered Spider gained access to Clorox's systems by simply calling Cognizant's help desk and requesting

password resets, where no identity verification was done.

Clorox argued the attack, which disrupted operations and product shipments, was worsened by Cognizant's failure to deactivate accounts and restore data properly. Cognizant responded by saying it was only hired for limited help desk services and was not

responsible for Clorox's cybersecurity.

This case highlights the importance of strong internal processes and identity verification, especially at the help desk level. Even simple requests can lead to serious consequences without proper safeguards in place.

Professional Development: Resilience and Navigating Setbacks

This week, interns from Solutions3 LLC participated in a Professional Development Session titled “Resilience and Navigating Setbacks.” The session began with an icebreaker designed to normalize moments of failure, during which interns reflected on personal experiences involving technical difficulties or times that required resilience.

In the fast-paced world of cybersecurity, resilience is essential, as each day can bring rapid changes and unexpected challenges. Interns learned the im-

portance of reframing setbacks, noting that while challenges are inevitable, how one responds makes all the difference. They were introduced to the Resilience Framework, which consists of four key steps: Pause, Reframe, Plan, and Move Forward. Interns were encouraged to apply this model to real-world situations, such as responding to cyber outages.

Additionally, the session introduced Carol Dweck’s concept of the Growth Mindset, which emphasizes continuous learning and adaptability, in contrast to a

fixed mindset. Interns left the session with reflective questions to consider throughout the week, aimed at strengthening their internal responses and fostering long-term resilience habits.

Helper or Hinder: How does AI enhance accessibility?

Artificial Intelligence has rapidly become one of the most important innovations of the 21st century. While the general public has been warned about potential harms such as deepfakes and advanced social engineering scams, it’s equally important to recognize the immense positive contributions AI can make to society.

One of its most powerful impacts is enhancing accessibility for disabled individuals around the world. AI enables a higher level of inclusion through tools like automated note-taking, autonomous transportation, augmentative and alternative communication devices, and adaptive learning platforms.

The previous list represents only a snapshot of the enhancements AI has brought to both communities and society at large.

As AI continues to deliver impactful tools and support, it is up to us to steer its development in a positive direction, allowing for a more accessible future.

“As AI continues to deliver impactful tools and support, it is up to us to steer its development in a positive direction, allowing for a more accessible future”

Did You Know?

If you're ever at an airport, hotel, café, or other public place, you may come across available and free USB charging stations. While they might seem like a quick and easy way to power up your phone, they can actually come with serious hidden risks.

A tactic known as juice jacking allows cybercriminals to com-

promise public USB ports and use them to install malware or steal personal data such as text messages, contact lists, and even keystrokes from your device.

This kind of attack often goes completely unnoticed until the damage is done.

To stay protected, avoid plugging into unfamiliar USB ports. It's recommended to always carry your own wall charger, bring a portable power bank, or use a USB data blocker.

A quick charge could cost you your data. Think before you plug in.

At Solutions³ LLC, we believe that empowering people is the key to sustainable success in cybersecurity, IT, and business service management as a whole. Our commitment to resource development is evident through mentorships, advanced training, and workforce development programs, including impactful internships and apprenticeships.

For more information on our internships, workforce development, or training, contact Mike Battistella at mike@solutions3llc.com or Shannon Conley at shannon.conley@solutions3llc.com.

Special Thanks to Our Sponsors

We are grateful for the generous support and partnership of the following organizations, whose contributions help make the Summer Cybersecurity Internship Program possible. Their support enables us to provide hands-on learning experiences, real-world simulations, and invaluable mentorship opportunities for our interns.

Editor's Corner

I'm incredibly grateful to have been part of the Solutions³ Cybersecurity Internship this summer. From day one, I was surrounded by sharp minds, a welcoming culture, and a leadership team that made learning feel both personal and professional. I came in uncertain about where I fit in cybersecurity, I'm leaving with clarity, growth, and a deeper understanding of the kind of people I want to work with.

This experience taught me how to collaborate effectively, build real-world deliverables, and appreciate the importance of shared values in a team environment. One standout lesson was learning how to break free from the "urgency

trap" using prioritization frameworks like the Eisenhower Matrix and ABC Method, tools that have reinforced how I approach my work and goals.

I'd like to thank all my fellow interns, Aaron, Andre, Bryan, Dominick, Jaylen, Jesus, John, and Julia, your drive and energy made this journey unforgettable. To our amazing leadership team: Mike Battistella, for his wisdom and steady composure; Shannon Conley, for her compassion and inspiring spirit; Kristen Nova, for her positivity and genuine investment in us interns; and Mark Marino, for always challenging our thinking. And a special

thank-you to Tricia Battistella, whose leadership as CEO made it all possible.

To future interns: Be curious. Be courageous. And always follow purpose, not just a paycheck.
